SMOKER HEALTH REPORT

Educational screening report • Not a medical diagnosis

Report category	Smoking / tobacco exposure
Risk status	Current or former smoking exposure
Purpose	Summarize important health risks associated with smoking
Assessment	Smoking history should be interpreted together with age, duration of smoking, cigarettes per da

Key health considerations

• **Cardiovascular system:** Smoking damages blood vessels and increases the risk of cardiovascular disease and stroke.

• **Lungs:** Long-term smoking is associated with chronic respiratory disease and lung cancer.

• **Circulation:** Tobacco exposure can impair blood flow and vascular function, which is particularly important when other vascular risk factors are present.

• **Diabetes and wound healing:** Smoking can adversely affect circulation and healing. In people with diabetes, this can add to existing risks of foot complications.

Smoking-history fields for clinical screening

Field	Example / entry
Smoking status	Current / Former / Never
Cigarettes per day	_____
Years of smoking	_____
Age started	_____
Quit date (if applicable)	_____
Other tobacco exposure	_____

Recommended follow-up

For a personalized assessment, a clinician can review smoking exposure together with blood pressure, glucose/diabetes status, cardiovascular history, respiratory symptoms, and other risk factors. Smoking cessation is associated with substantial health benefits over time.
